CANADIAN CYBERSECURITY, MADE SIMPLE

Security that fits your business.

Hexius helps SMBs and startups find and fix what attackers would exploit, explained in plain language, on a budget that makes sense. Every engagement is scoped to your reality, never a fixed package.

// For SMBs

Security made easy

Testing, simulations and training, without the enterprise overhead.

// For startups

Advisory that scales with you

Fractional CISO and AI security: a roadmap to get you audit-ready.

// Products

Hexposure

Your external attack surface, analyzed every month. See overleaf.

Our services

APT — **Application pentest**
White-box and grey-box coverage, business logic and fraud abuse, ticket-ready findings.

SE — **Phishing and social engineering**
Targeted phishing, vishing and human risk assessment, built from your real org structure.

OSINT — **External exposure**
People, exposed systems, data and metadata: see what attackers see before they target you.

TTX — **Incident simulation**
Assume-breach tabletop exercises with real APT scenarios, for technical and executive teams, with playbook gap analysis.

AST — **Training**
Theory and hands-on training for developers and executives, with real exploitation demos.

vCISO — **Advisor / vCISO**
Roadmap, risk, compliance and program ownership, without a full-time hire.

What you get

Deliverables you can use the next day: an executive summary for leadership, detailed playbooks for your teams, a ticket-ready issue list for developers and step-by-step remediation guidance. Business risk, not just technical detail.

WE THINK LIKE ATTACKERS. WE WORK FOR YOU.

Hexius is led by Patrick Mathieu, with 18+ years in application security, penetration testing and offensive security. Real-world experience, not checkbox compliance.

IDENTIFIED RISKS RELATED TO YOUR SHADOW IT

See your business the way an attacker does.

A forgotten subdomain, a port left open “just for a test”, an API key in a JavaScript file, a former employee’s password in a leak. Most SMBs protect what they know very well. Hexposure finds the rest, from the outside, with no agent to install and no access to your systems.

// Across 50+ organizations analyzed

54%
had at least one critical finding

51%
publicly exposed a cloud service

20%
had a secret exposed in code or a public URL

Not careless organizations. Busy ones, like yours.

How it works

01 · Map

Everything visible from the Internet

Subdomains, IP addresses, live services, application endpoints and certificates, across all 65,535 ports.

02 · Analyze

30+ techniques, 250+ checks

Every exposure is ranked by real business impact, not a generic score.

03 · Connect

Attack paths, not alerts

Findings chain together step by step, exactly as an attacker would follow them.

What you get

- The list that matters, in priority order
- A plain-language “why it matters” and clear next steps
- A health score you can defend to your board or insurer
- A fresh scan every month, with fixes automatically revalidated

Who it’s for

- SMBs and startups that want to know what they expose
- Managed service providers (MSPs) protecting multiple clients
- Owners of external risk who have to report on it

BECAUSE A LETTER GRADE IS NOT A SECURITY PROGRAM

Rating vendors score you from passive signals and stop there. Hexposure explains the issues and helps you raise your security maturity.

No agent · No internal access · Nothing to install

How many subdomains do you expose? We can tell you.

Private beta cohort, limited spots
